

Technologies to reduce CO2 emissions

About

Roberto Pongutá, VP Global Operations - Technical & Energy, and Liliana González, Energy Project Advisor walk us through the different technologies we are implementing and testing to reduce our CO2 emissions

- *Technologies to reduce our carbon footprint in cement operations where the highest CO2 emissions are generated*
- *Solutions for CO2 reduction not only in clinker & cement but also alternatives for carbon capture, utilization and storage*

All technologies either running in operations or in various stages of pilot & development

We aim to challenge everyone to contribute to our emission reduction target
